

DAY & NIGHT

TEACHER'S GUIDE SCIENCE - DAY & NIGHT AGES: 4 - 6

This activity gets students thinking about the changes that happen between day and night. They will walk around your outdoor space drawing or writing things they can see in the day time. They will then think about what would be different at night. Is there anything they won't be able to see? What new things do they think they'll be able to see.

They can complete the next section just through discussion, or find a time to go outside at night to complete the section. This could be done as a home learning project or on an overnight camp.

This activity is great to get your little ones thinking about the different animals and their behaviors as well as beginning to understand how the earth moves around the sun. It's also an excellent way to develop their observation and comparison skills.
